

CURRENT STATE OF PHYSICIAN REVIEWS ON HEALTHGRADES.COM

Webscraping project presentation

Yan Qi

1/30/2017

Background

What is Healthgrades.com?

- It is a website listing comprehensive physician and hospital profiles to facilitate connection between patients and providers
- Yelp for doctors?! Patients can search for physicians based on specialty, location, and read the detailed doctors profile in order to choose a provider
- Each doctor's page includes reviews from patients in the form of star ratings and qualitative comments
- Physician profiles also include demographic information, practice location, areas of expertise, medical training history, etc.

Project Objective

- Analyze physician performance by looking at patient reviews
- Understand what physician characteristics impact rating
- Assess data quality and caveats from this website and implications

Outline

- Introduction to the dataset
- Distribution of overall rating
- What drives / influences overall rating?
 - Number of reviews
 - Age
 - Gender
 - Doctor's performance vs. office staff performance
- Conclusions
- Future work

Pilot analysis includes ~950 gastroenterologists in New York City metro area

Ratings and doctor demographic information were scraped for analysis

| Ratings through patient survey (1-5 stars rounded to 0.5 star precision) | |
|---|---|
| Overall Rating | <i>Likelihood to recommend doctor to friends and family</i> |
| Doctor Score | <i>Level of trust in provider's decisions</i> |
| | <i>How well provider explains medical condition(s)</i> |
| | <i>How well provider listens and answers questions</i> |
| | <i>Spends appropriate amount of time with patients</i> |
| Staff Score | <i>Ease of scheduling urgent appointments</i> |
| | <i>Office environment, cleanliness, comfort, etc.</i> |
| | <i>Staff friendliness and courteousness</i> |

Doctor characteristics

Used in analysis

- **Age**
- **Gender**
- **Number of reviews**

Scraped, not used

- *Main practice name*
- *Main practice address*
- *Educational history (medical school, residency, fellowship hospitals)*
- *Number of insurance plans accepted*

Not scraped

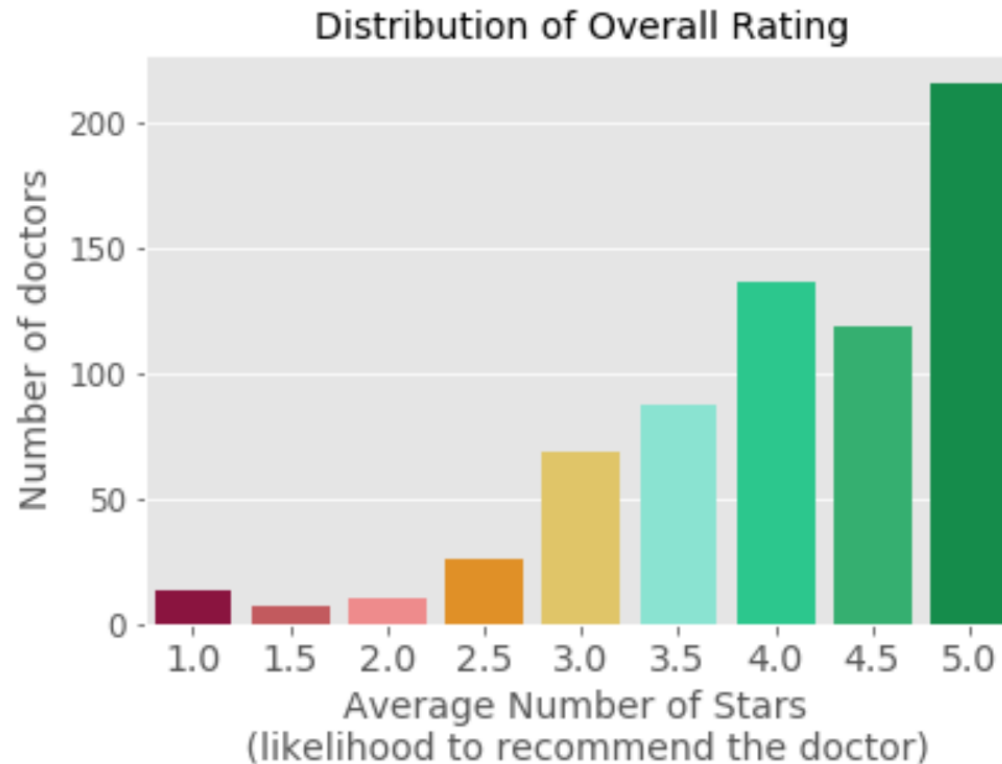

- *Qualitative comments from patient reviews*
- *Top conditions and procedures*
- *Legal action background check*
- *Languages spoken*

Healthgrades has collected > 5 million patient reviews nationally

The NY Metro GI doctor data contained a number of missing values for the different variables

| Variable | % of Missing Value | N available for analysis |
|---|--------------------|--------------------------|
| Age | 22% | 737 |
| Gender | 7% | 884 |
| Overall Rating / Doctor Score / Staff Score | 28% | 681 |
| Practice Name | 12% | 681 |
| Fellowship Hospital | 41% | |
| Residency Hospital | 33% | |
| Medical School | 25% | |
| Number of Insurance Accepted | 94% | |

On first glance, it would appear that more than a third of doctors are getting perfect 5 stars ...

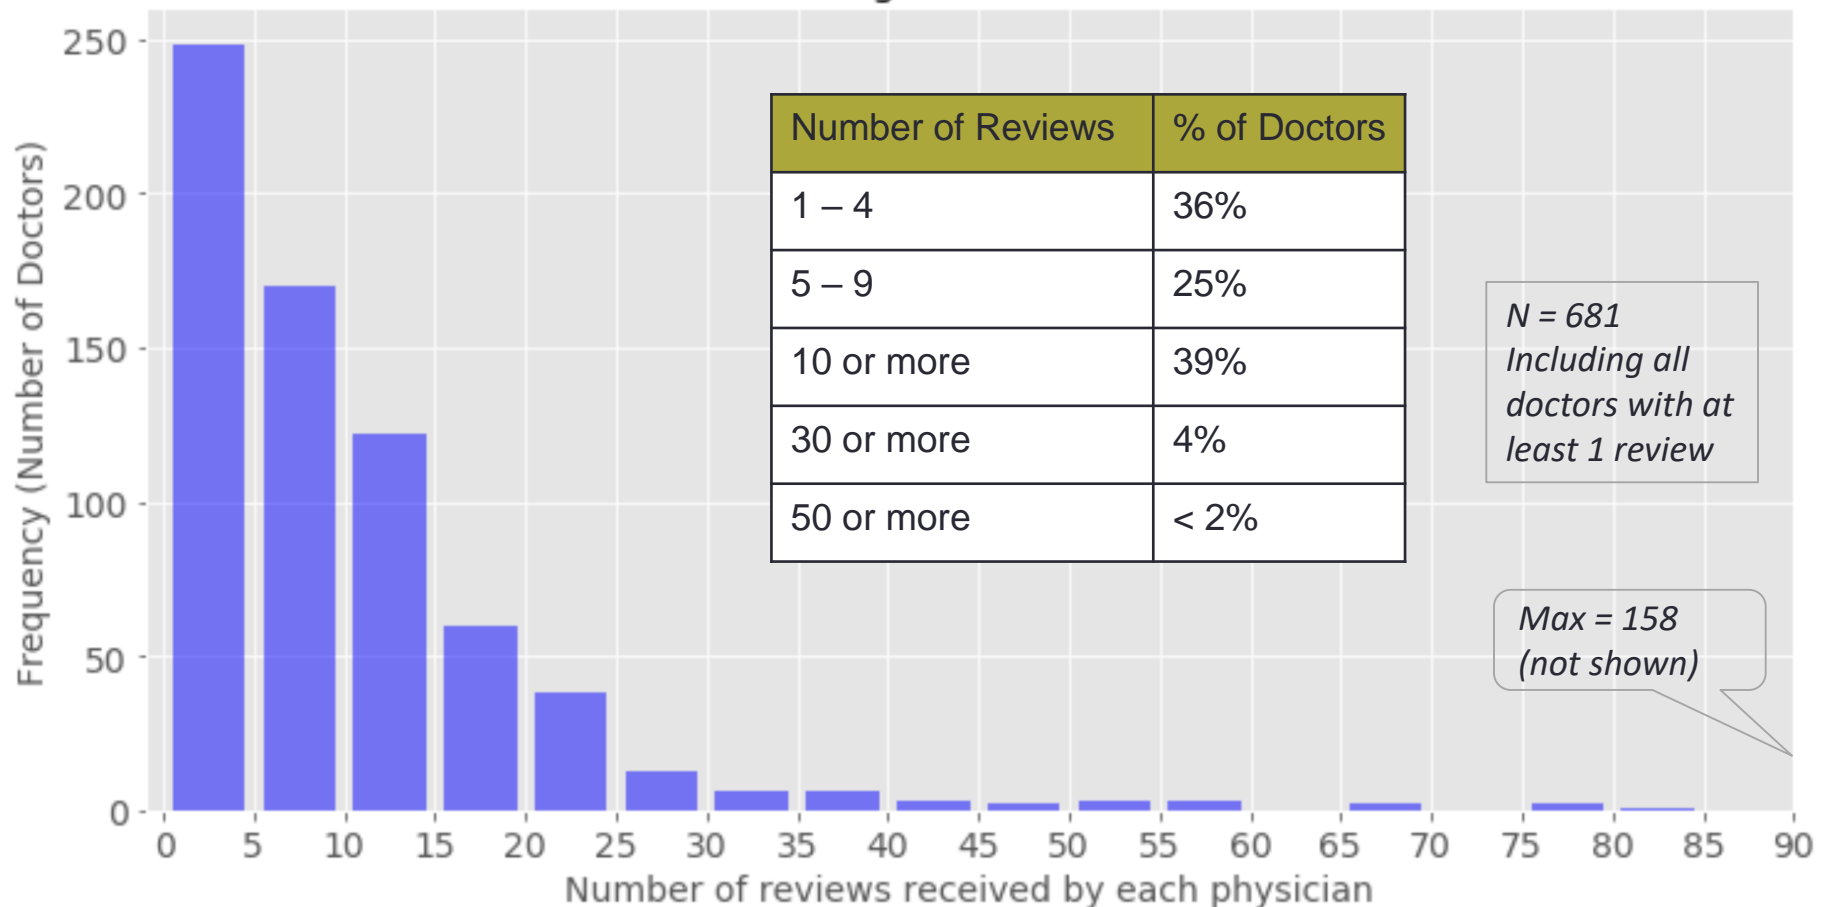

*N = 681
Including all
doctors with
at least 1
review*

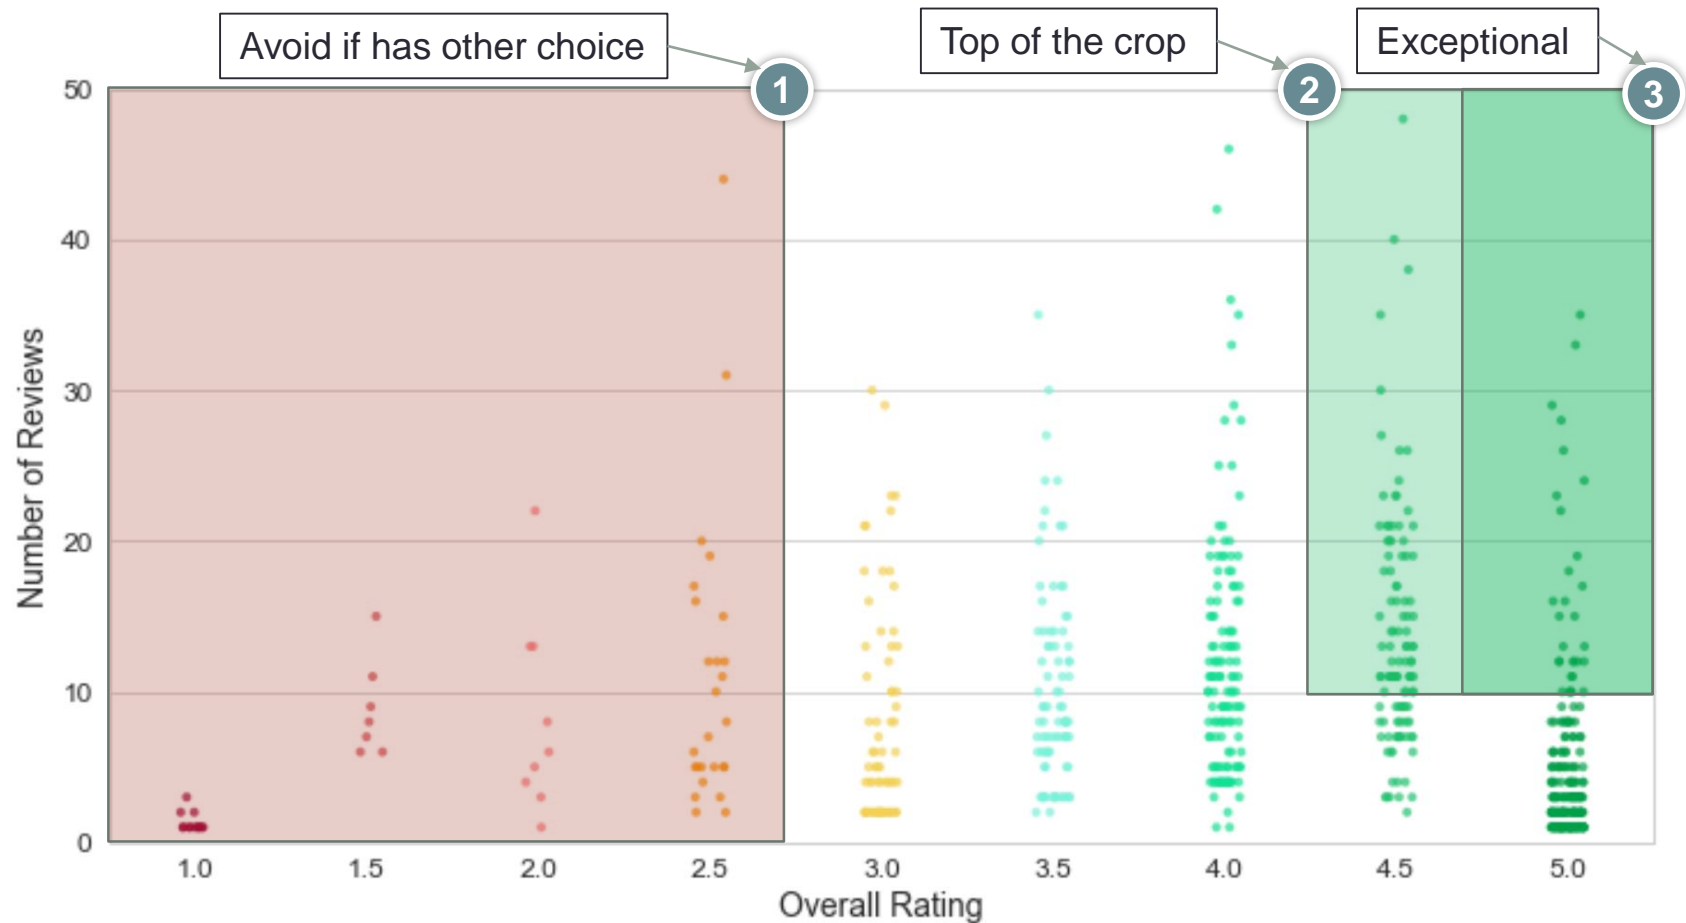

But, a 5 star rating based on 1 review \neq a 5 star rating based on 10 reviews!

The number of reviews follows an extremely skewed distribution with 36% doctors each having < 5 reviews

Histogram of Number of Reviews
for Gastroenterologists in New York Metro Area

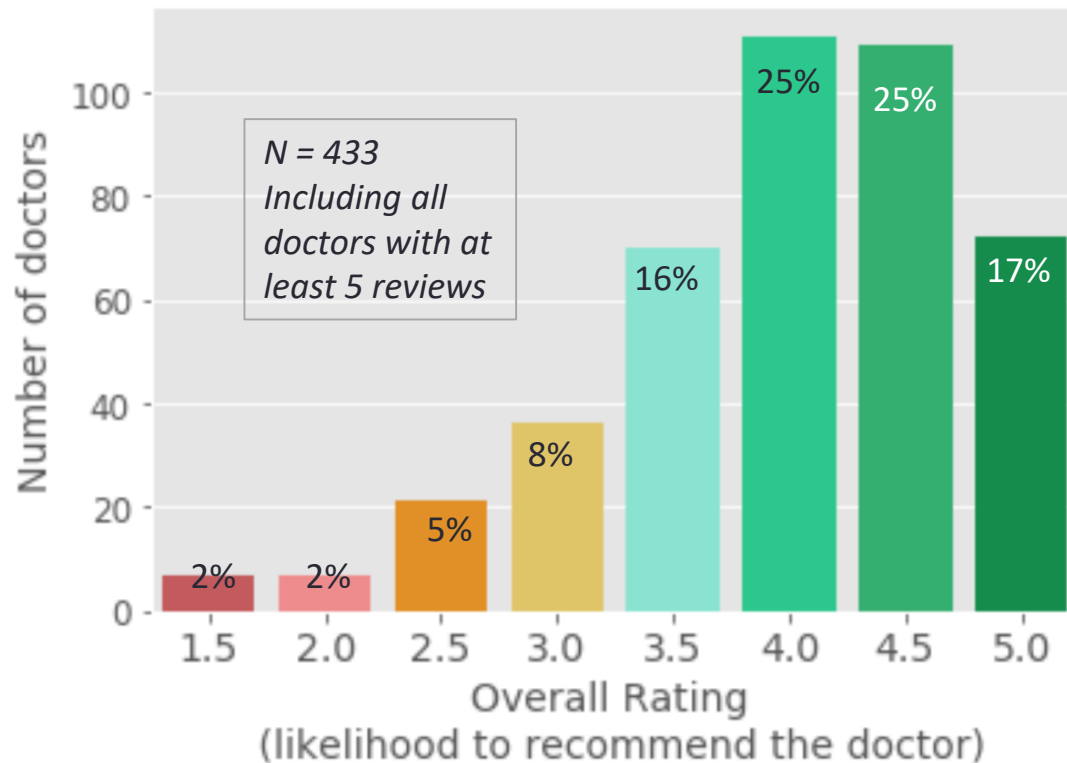

Examining rating in conjunction with the number of substantiating reviews help consumer pick providers in a more reliable way

- Doctors with low rating in generally much less likely to get a large number of reviews
- Among patients submitting a review, more are motivated by positive than negative experiences

Only including ratings based on 5 or more reviews, the distribution still looks very favorable toward high scores

Hypotheses

- The average quality of gastroenterologists in NY metro area is very high and patients are truly highly satisfied
- Selection bias in those who are willing to submit a survey vs. those who are not

What factors influence the overall rating?

We will explore the relationship between rating and doctor age, gender, and doctor's own vs. office staff's performance

| Factor | Question |
|---|---|
| Doctor's own performance vs. Staff Performance | <ul style="list-style-type: none">• <i>How well do doc score and staff score correlate with overall rating?</i>• <i>How well does doctor score correlate with staff score?</i>• <i>What kind of impact does office staff's performance have on the doctor's overall rating?</i> |
| Age | <i>Do experienced doctors get better reviews?</i> |
| Gender | <i>Is there any difference between the ratings received by female vs. male GI specialists?</i> |

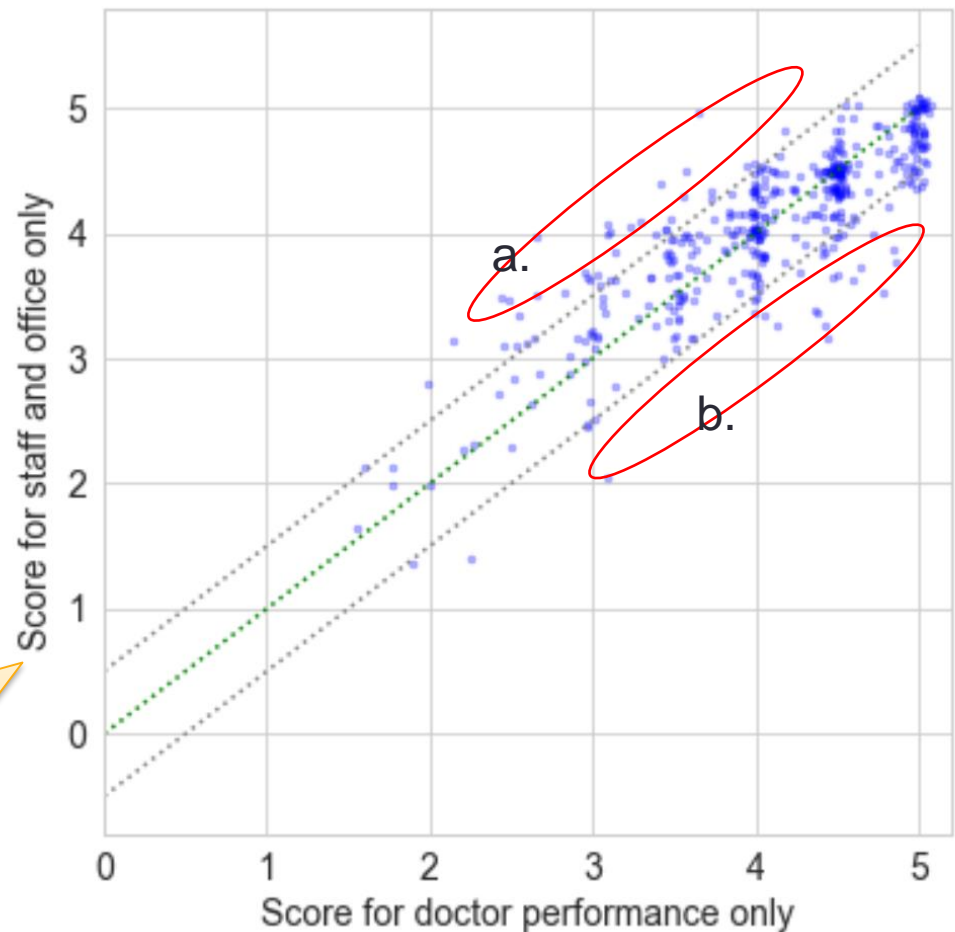

Staff scores and doctor scores are generally very concordant, but it is not uncommon for the two to differ by > 0.5 stars

Pearson Correlation

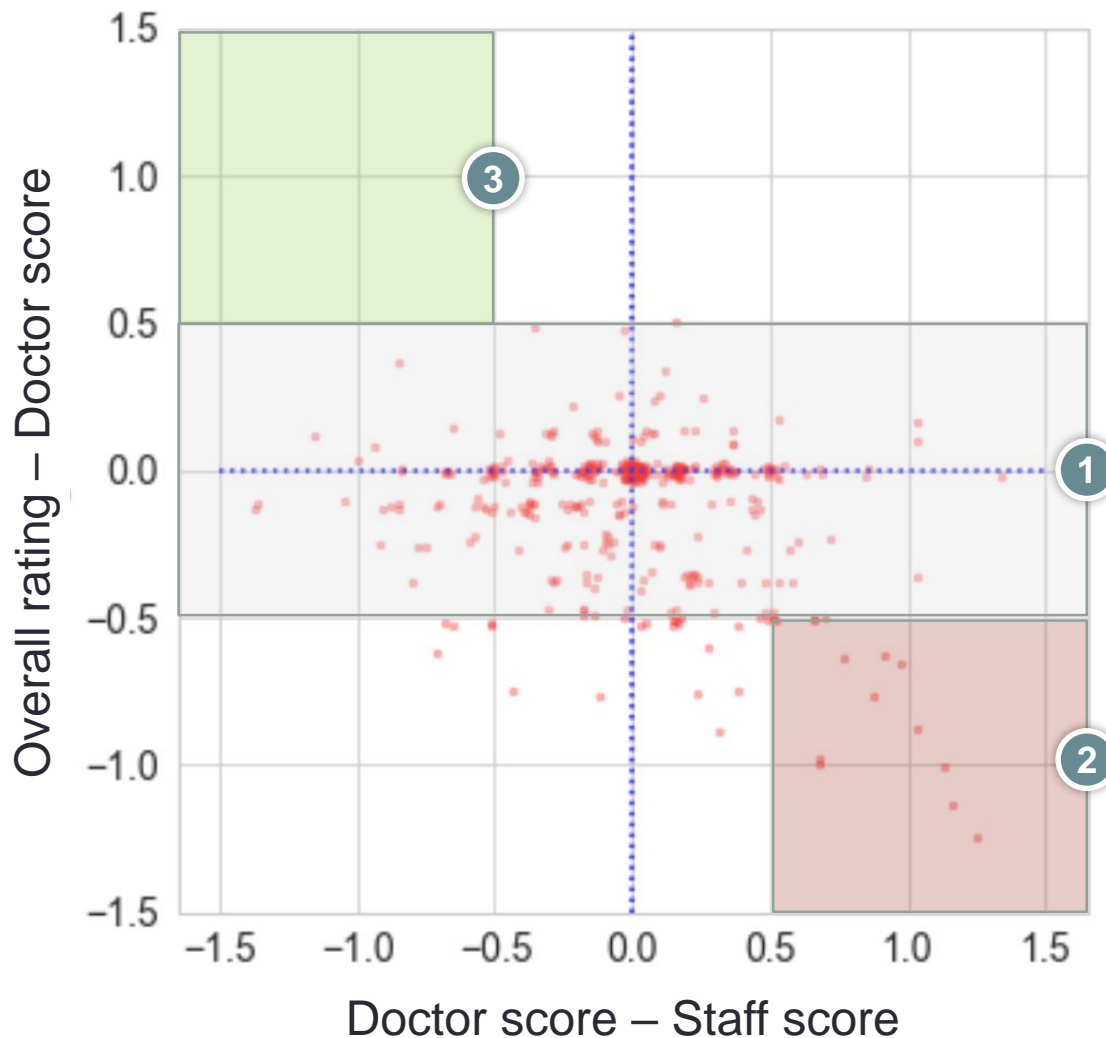

| | doc score | staff score | rating |
|-------------|-----------|-------------|--------|
| doc score | | 0.84 | 0.96 |
| staff score | | | 0.86 |
| rating | | | |

What happens to the overall rating when the staff's score is

- Higher than doctor's score?
- Lower than doctor's score?

Overall likelihood to recommend a physician is primarily driven by physician factors, but can be dragged down by poor office and staff performance

3. When office and staff score is better than the doctor's, it rarely lifts the overall rating

1. Most of the time, overall rating closely mimics the score for doctor's performance

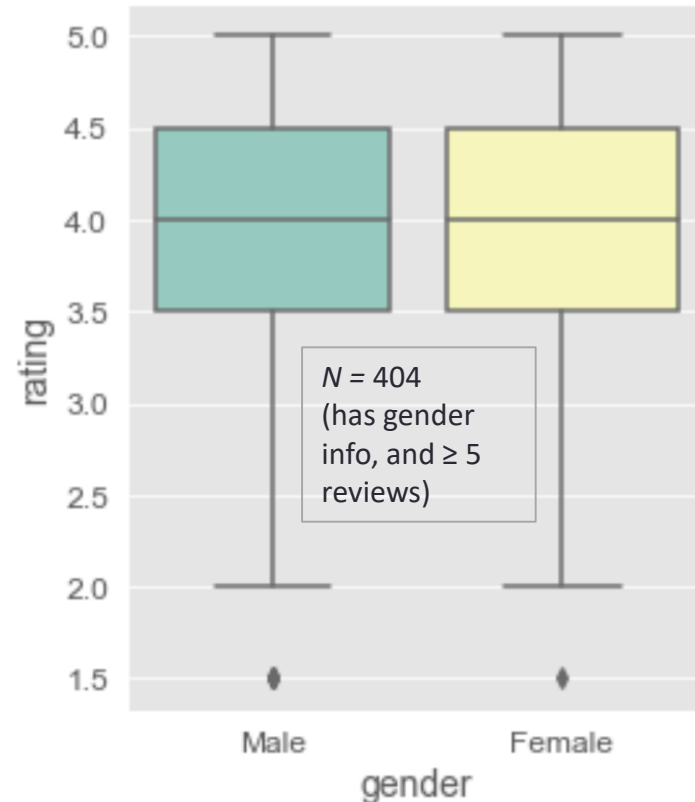

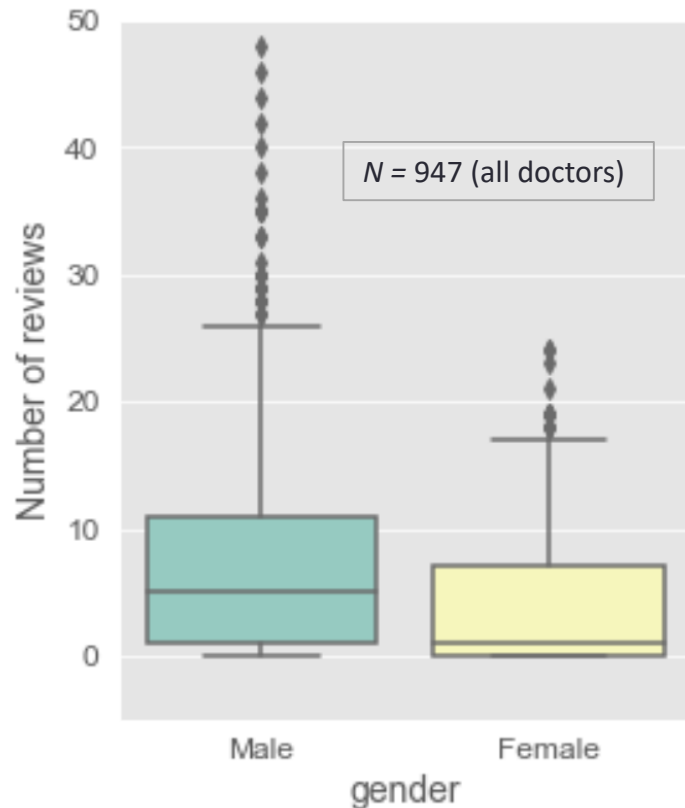

2. When office and staff quality is significantly below that of the doctor, overall rating suffers

Surprisingly, more experienced doctors do not have a higher average rating than younger ones

One way anova test shows there is no statistically significant difference between the group means

Number of reviews is biased by gender, but rating distribution is not

- Female doctors tend to have fewer reviews than male doctors (p-val = 0.0002)
- The doctors with > 25 reviews are almost all male

Conclusions

- What healthgrades has done is a great effort, but the current data collected have a number of potential caveats, such as
 - Ratings heavily tilted toward the higher end and lack dynamic range
 - The way search result is ordered by “best match” may promote rich-gets-richer does not help generate reviews more evenly across the physician universe
- GI doctors in NYC metro with different length of time in practice are perceived similarly by patients in terms of bedside manner and quality of interaction
- Female GI specialists have much lower visibility on healthgrades as reflected by the smaller number of reviews, but their ratings do not differ from the male doctors
- Overall rating is primarily driven by doctor’s own performance. Negative experience with the office staff can bring down the overall rating while positive experience generally does not lift the overall rating

Future work

| Questions | Analysis |
|--|--|
| What are the doctor or staff qualities that patients appreciate the most? | Word cloud analysis of qualitative patient comments (associated with 5 stars) for top rated doctors |
| What are the doctor or staff qualities lend to very negative patient experience? | Word cloud analysis of qualitative patient comments (associated with low stars) for doctors with poorest ratings |
| Do the same trends hold in geographies other than NY metro? | Similar to this analysis and compare geographies |
| How do the rating trends differ by specialty? | Similar to this analysis and compare specialties |

Trends from analysis of cardiologists in NYC metro very similar to those from the GI doctor analysis

APPENDIX

Healthgrades has a good coverage of physicians from a variety of specialties, including gastroenterologists

- Healthgrades reports a larger number of doctors than AAMC
- Healthgrades physician universe likely includes both active and inactive physicians

The ~950 gastroenterologists in New York metro area represent ~5% of all GI doctors in the nation

Quick look at the exceptional doctors shows that some are from large group practices and most completed fellowship in local hospitals

Top 2 practices based on number of exceptional doctors

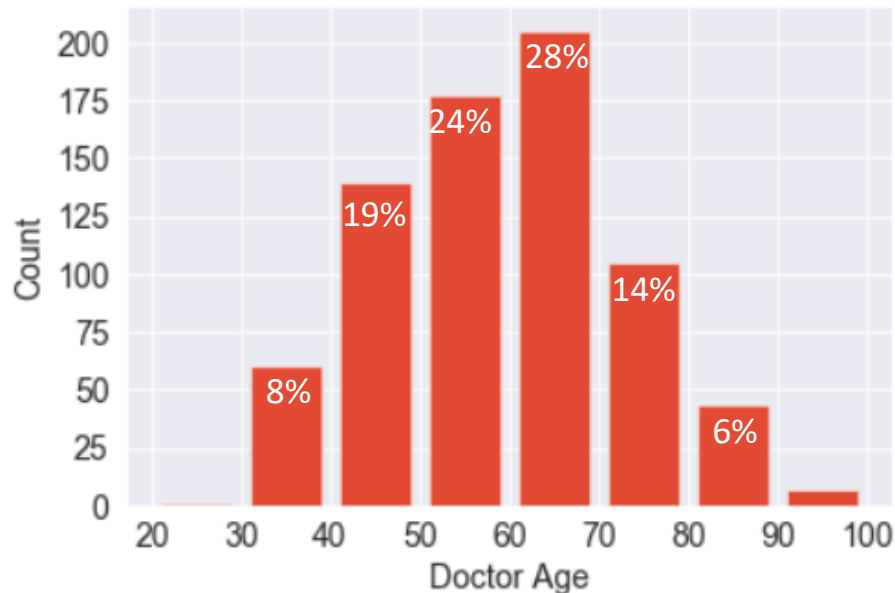

| Practice name | # of exceptional doctors |
|---------------------------|--------------------------|
| GOTHAM MEDICAL ASSOCIATES | 3 (10%) |
| Concorde Medical Group | 2 (7%) |

Top 6 practices based on total # of GI doctors

| Practice name | # | % |
|------------------------------|----|------|
| Mount Sinai Gastroenterology | 31 | 3.7% |
| Concorde Medical Group | 14 | 1.7% |
| Advantage Care Physicians | 11 | 1.3% |
| NYU LANGONE HOSPITAL CENTER | 10 | 1.2% |
| MOUNT SINAI HOSPITAL | 10 | 1.2% |
| GOTHAM MEDICAL ASSOCIATES | 9 | 1.1% |

Gastroenterologists 50 to 70 years old account for 52% of the pool and tend to receive more patient reviews than other groups

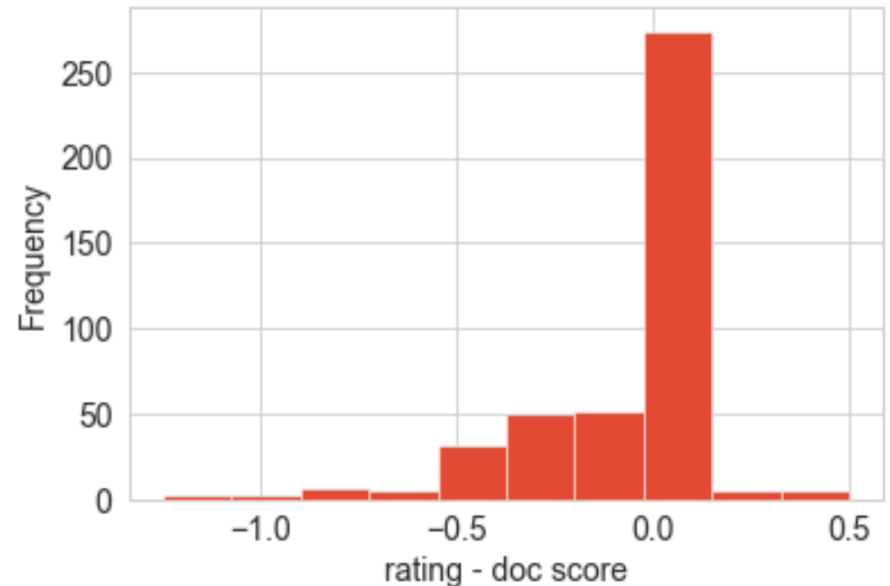

$N = 737$ doctors with age information

The higher number of reviews per physician in the 50-70 age range could be due to:

- More accumulated patients over time due to longer time in practice
- Higher patient volume due to patient preference for physicians in this group

Doctor's score is usually higher than the staff score and the overall rating is either same as doctor's score or lower

Patients are most satisfied with cardiologists in NYC metro area aged between 40 to 60 years old
